R measurement at KEDR

Korneliy Todyshev
KEDR collaboration

27 February 2019

International Workshop on e^+e^- collisions from ϕ to ψ

$R(s)$ measurement. Motivation.

"Priore loco" (In first)

$$R = \frac{\sigma(e^-e^+ \rightarrow \text{hadrons})}{\sigma(e^-e^+ \rightarrow \mu^-\mu^+)} \approx$$

In first approximation:

$$R(s) \simeq 3 \sum e_q^2$$

$R(s)$ is used to determine:

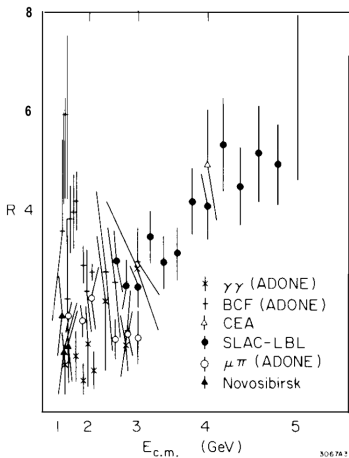

- $\alpha_s(s)$
- $(g_\mu - 2)/2$
- $\alpha(M_Z^2)$

F. Jegerlehner arXiv:1511.0447

$R(s)$ measurement. Experimental data.

“Confer!” (Compare!)

PDG data at the present time.

“The ratio R as of July 1974”
Presented by Richter at the
London conference in July 1974.

VEPP-4M and KEDR

"Actum atque tractatum" (done and discussed)

Beam energy	$1 \div 5 \text{ GeV}$
Number of bunches	2×2
Luminosity 1.8 GeV	$1.5 \times 10^{30} \text{ cm}^{-2} \text{ s}^{-1}$

Energy measurement:

- Resonant depolarization method:
 - Instant measurement accuracy $\sim 1 \text{ keV}$
 - Energy interpolation accuracy $10 \div 30 \text{ keV}$
- Compton backscattering method $\sim 100 \text{ keV}$

- Vertex detector
- Drift chamber
- Aerogel threshold counters
- ToF counters
- Lkr calorimeter
- Superconducting coil
- Yoke
- Muon chambers
- CsI calorimeter
- Compensating solenoid

1 m

R measurement between J/ψ and $\psi(2S)$

“Consideratio naturae”(contemplation of nature)

The observed multihadron cross section as a function of the c.m. energy

$\sigma_{mh}^{obs}, \text{nb}$

Experiment 2010-2011

$\sigma_{mh}^{obs}, \text{nb}$

Experiment 2014-2015

- The c.m. energy range between 3.076 and 3.72 GeV studied
- An integrated luminosity of 2.7 pb^{-1} collected at 9 energies 3.077, 3.120, 3.223, 3.315, 3.418, 3.500, 3.521, 3.618, 3.719 GeV
- $\sim (2 - 6) \times 10^3$ m.h. events per point, $\sim 38 \times 10^3$ in total

“Modus operandi” (procedure; method of operating)

The way that we are measuring R :

$$R = \frac{\sigma_{obs}(s) - \sum \varepsilon_{\psi}^{tail}(s)\sigma_{\psi}^{tail}(s) - \sum \varepsilon_{bg}^i(s)\sigma_{bg}^i(s)}{\varepsilon(s)(1 + \delta(s))\sigma_{\mu\mu}^0}$$

with $\sigma_{obs}(s) = \frac{N_{mh} - N_{res.bg.}}{\int \mathcal{L} dt}$ where N_{mh} represent all events pass hadronic selection criteria, $N_{res.bg.}$ – residual machine background

$\sum \varepsilon_{\psi}^{tail}(s)\sigma_{\psi}^{tail}(s)$ is contribution from J/ψ and $\psi(2S)$ resonances

$\sum \varepsilon_{bg}^i(s)\sigma_{bg}^i(s)$ is contribution from physical processes: $e^+e^- \rightarrow l^+l^-$, $\gamma\gamma$ -processes.

$\varepsilon(s)$ – multihadron efficiency.

$$1 + \delta(s) = \int dx \frac{1}{1-x} \frac{\mathcal{F}(s, x)}{|1 - \tilde{\Pi}(s(1-x))|^2} \frac{\tilde{R}(s(1-x))\varepsilon(s(1-x))}{R(s)\varepsilon(s)}$$

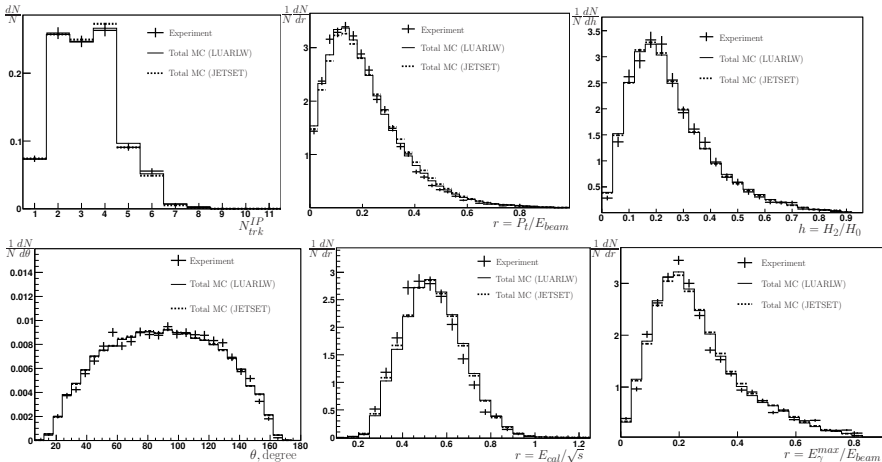

$\mathcal{F}(s, x)$ – radiative correction kernel (E.A.Kuraev, V.S.Fadin

Sov. J. Nucl. Phys. 41(466-472)1985) Here $\tilde{\Pi}$ and \tilde{R} does not includes J/ψ and $\psi(2S)$ resonances. **To determine the contributions of the J/ψ and $\psi(2S)$ without external data, the additional data samples of about 0.4 pb^{-1} (2010-2011) and 0.34 pb^{-1} (2014-2015) were collected in the vicinity of peak regions.**

Simulation: JETSET and LUARLW

"Punctum saliens" (The most important thing)

Properties of hadronic events produced in the uds continuum at 3.119 GeV (2014-2015).

Here N is the number of events, N_{trk}^{IP} is the number of tracks originated from IP, P_t is a transverse momentum of the track, H_2 and H_0 are Fox-Wolfram moments, θ is a polar angle of the track, E_{cal} is energy deposited in the calorimeter, E_{γ}^{max} is energy of the most energetic photon.

Systematic uncertainties

"Satius est supervacua discere quam nihil"

Comparison with others experiments

"De omnibus dubitandum" (All is to be doubted)
René Descartes

The quantity R versus the c.m. energy and the sum of the prediction of perturbative QCD and a contribution of narrow resonances.

In the c.m.energy range 3.08-3.72 GeV the weighted average $\overline{R}_{uds} = 2.204 \pm 0.014 \pm 0.026$ is approximately one sigma higher than that theoretically expected, $R_{uds}^{pQCD} = 2.16 \pm 0.01$ calculated according to the pQCD. In the lower c.m.energy range 1.84-3.05 GeV the weighted average is $2.225 \pm 0.020 \pm 0.047$ (the pQCD prediction of 2.18 ± 0.02).

An application of the $R(s)$

"Natura appetit perfectum, ita est lex"

(Nature desires perfection, so also does the law)

Correlated uncertainties of R_{uds} in %

$$R_{uds}(s) \simeq 2 \times \left(1 + \frac{\alpha_s}{\pi} + \frac{\alpha_s^2}{\pi^2} \times \left(\frac{365}{24} - 9\zeta_3 - \frac{11}{4} \right) \right)$$

where ζ is the Euler-Riemann zeta function,

$$\alpha_s(s) = \frac{1}{b_0 t} \left(1 - \frac{b_1 l}{b_0^2 t} + \frac{b_1(l^2 - l - 1) + b_0 b_2}{b_0^4 t^2} + \frac{b_1^3(-2l^3 + 5l^2 + 4l - 1) - 6b_0 b_2 b_1 l + b_0^2 b_3}{2b_0^6 t^3} \right)$$

with $t = \ln \frac{s}{\Lambda^2}$, $l = \ln t$ parametrized in terms of the QCD scale parameter Λ and coefficients b_0, b_1, b_3 (can be found in PDG). To determine Λ , we minimise the χ^2 function

$$\chi^2 = \sum_i \sum_j \left(R_{uds}^{\text{meas}}(s_j) - R_{uds}^{\text{calc}}(s_j) \right) C_{ij}^{-1} \left(R_{uds}^{\text{meas}}(s_j) - R_{uds}^{\text{calc}}(s_j) \right),$$

The obtained value of $\Lambda = 0.361_{-0.174}^{+0.155}$ GeV corresponds to $\alpha_s(m_\tau) = 0.332_{-0.092}^{+0.100}$. If the next order of pQCD is included in the expansion of R_{uds} , the fitting results are as follows: $\Lambda = 0.437_{-0.215}^{+0.210}$ GeV and $\alpha_s(m_\tau) = 0.378_{-0.120}^{+0.173}$.

$\alpha_s(m_\tau)$ determined from our $R(s)$ results is consistent with obtained in semileptonic τ decays ($\alpha_s(m_\tau) = 0.331 \pm 0.013$)

“Omne futurum incertum”(Every future thing is uncertain)

R measurement in the energy range
4.56–6.96 GeV.

- First scan finished in 2018. An integrated luminosity $\sim 4 \text{ pb}^{-1}$ collected at 8 equidistant points with a step $\sim 0.3 \text{ GeV}$ from 4.71 to 6.81 GeV
- In 2019 we plan to start the second scan (10 equidistant points in the energy range $4.56 \div 6.96 \text{ GeV}$).

F. Jegerlehner arXiv:1511.0447

"Jucundi acti labores"(past labors are pleasant)
Cicero

- KEDR measured the R values at 22 center-of-mass energies between 1.84 and 3.72 GeV.
In the energy range between 1.84 and 3.05 GeV the achieved accuracy is about or better than 3.9% at most of the energy points with a systematic uncertainty less than 2.4%.
For the energies above J/ψ resonance the total error is about or better than 2.6% and a systematic uncertainty of about 1.9%.
- We plan to take data at the energy range from 4.56 to 6.96 GeV
