

# Theoretical aspects of XYZ states

Feng-Kun Guo

Institute of Theoretical Physics, CAS

International Workshop on  $e^+e^-$  Collisions from Phi to Psi 2019

Novosibirsk , Feb. 25 – March 1, 2019

# Main reactions producing XYZ

- In  $e^+e^-$  collisions

- Energy coverage limited:  $\lesssim 4.6$  GeV @BESIII, thus
  - ❑ little is known about vector states above that energy;
  - ❑ for other quantum numbers, even lower mass accessible:  $e^+e^- \rightarrow X + \gamma/\text{pions}$ ; resonances decaying into  $\psi\phi, \psi\omega$  cannot be studied
  - ❑ No access to charm-anticharm baryon-pair thresholds, e.g.,  $\Lambda_c^+\Lambda_c^-$ ; no access to thresholds of a pair of excited charm mesons, e.g.,  $D_1\bar{D}_1$
- $e^+e^- \rightarrow \gamma_{\text{ISR}}Y$ : low rates due to an additional factor of  $\alpha$

- In weak decays  $b \rightarrow [c\bar{c}]s$

- Energy region limited:  $< m_B - m_K \approx 4.8$  GeV
- Final states with 3 or more hadrons:  $B \rightarrow K\psi\pi, K\psi\pi\pi, K\psi\omega, K\psi\phi, \dots$

Many states observed, e.g., X(3872), X(3915), ...

# Main reactions producing XYZ

➤ Difficulties for multi-hadron final states

✓ Many resonances from the cross channel:

branching fractions often unknown, interference between overlapping resonances, ...

✓ Complicated 3-body FSI:

intermediate states can be different from external ones; **threshold cusps**;  
**triangle singularities** (TS) singularities

# $Z_c(4430, 4200)$ : ambiguity due to TS

S.X. Nakamura, K. Tsushima, 1901.07385

- Peaks produced at the right energy

- $\mathcal{B}(Z_c(4430) \rightarrow \psi'\pi) \gg \mathcal{B}(Z_c(4430) \rightarrow J/\psi\pi)$  explained using

$$\frac{\mathcal{B}(Y(4260) \rightarrow \psi'\pi\pi)}{\mathcal{B}(Y(4260) \rightarrow J/\psi\pi\pi)} = 0.1 - 0.5$$

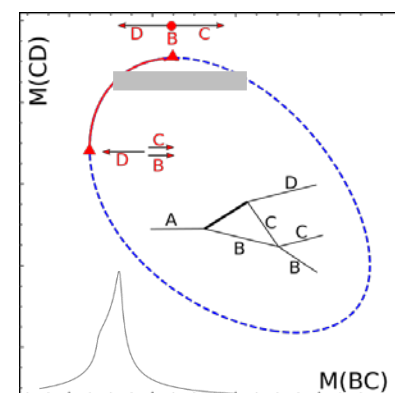

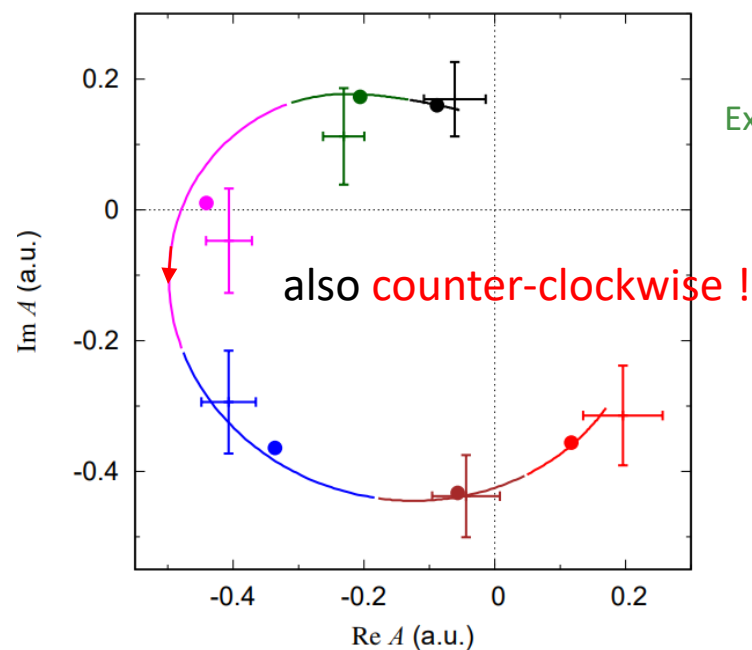

From a combined fit by J. Zhang, L. Yuan, EPJC77(2017)727

# $Z_C(4430, 4200)$ : ambiguity due to TS

S.X. Nakamura, K. Tsushima, 1901.07385

- Argand plot for  $Z_C(4430)$ : diagram (a) interfered with a constant complex bg.

TS sensitive to kinematics!

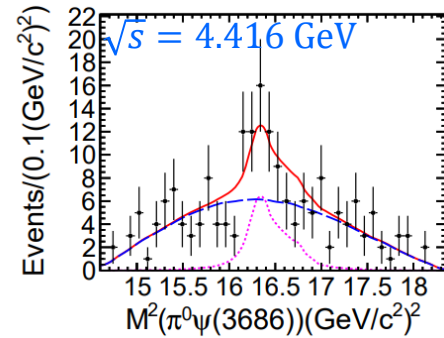

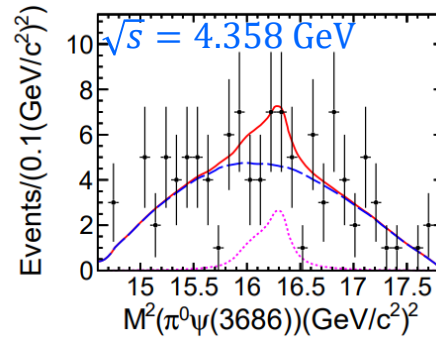

# TS: nontrivial energy dependence

Highly nontrivial energy dependence expected, e.g.  $e^+e^- \rightarrow \psi'\pi^+\pi^-$

X.-H. Liu, PRD90(2014)074004

Difficulty/opportunity of identifying  $Z_c$

BESIII measurement of  $e^+e^- \rightarrow \psi'\pi^0\pi^0$

BESIII, PRD97(2018)052001

# $P=+$ spin multiplets

- Heavy quark spin symmetry: multiplet structure

Cleven et al., PRD92(2015)014005

- For charmonia, spin triplet:  $\chi_{cJ}(J^{++}, J = 0,1,2)$ ; and spin singlet:  $h_c(1^{+-})$
- For hadro-charmonia, similar structure as charmonia
- For tetraquark models, controlled by  $c\bar{c}$  (not necessarily color singlet) interaction
- For hadronic molecules, controlled by meson-meson interaction. Examples:
  - ❑ For  $X(3872)$ , an  $X_2(2^{++})$  is generally expected, not identified so far
  - ❑ Existence of  $0^{++}$  and  $1^{+-}$  unknown
  - ❑ For  $Z_b$  states,  $W_{bJ}(J^{++}, J = 0,1,2, I = 1)$  expected

Bondar et al., PRD84(2011)054010;  
See talk by Alexey Nefediev

$W_{bJ}$  not seen so far in  $Y\pi\pi$  in search of  $X_b$  CMS, PLB727(2013)57; ATLAS, PLB740(2015)199

(re-interpreted)

- More insights from studying states with related  $J^{PC}$  (maybe the same multiplet)

- States with  $J^{++}$  at around 3.9 GeV:  $X(3860)$ ,  $X(3872)$ ,  $X(3915)$ ,  $\chi_{c2}(3930)$ , ...
- $\tilde{X}(3872)$  by COMPASS, consistent with  $1^{+-}$ , better called  $h_c(3860)$ , relation to X?

$M = (3860.0 \pm 10.4) \text{ MeV}, \Gamma < 51 \text{ MeV}$  COMPASS, PLB783(2018)334

# Vector charmonium(-like) states

- In  $e^+e^-$ , from decays of higher vector charmonia
- Vector charmonium(-like) states

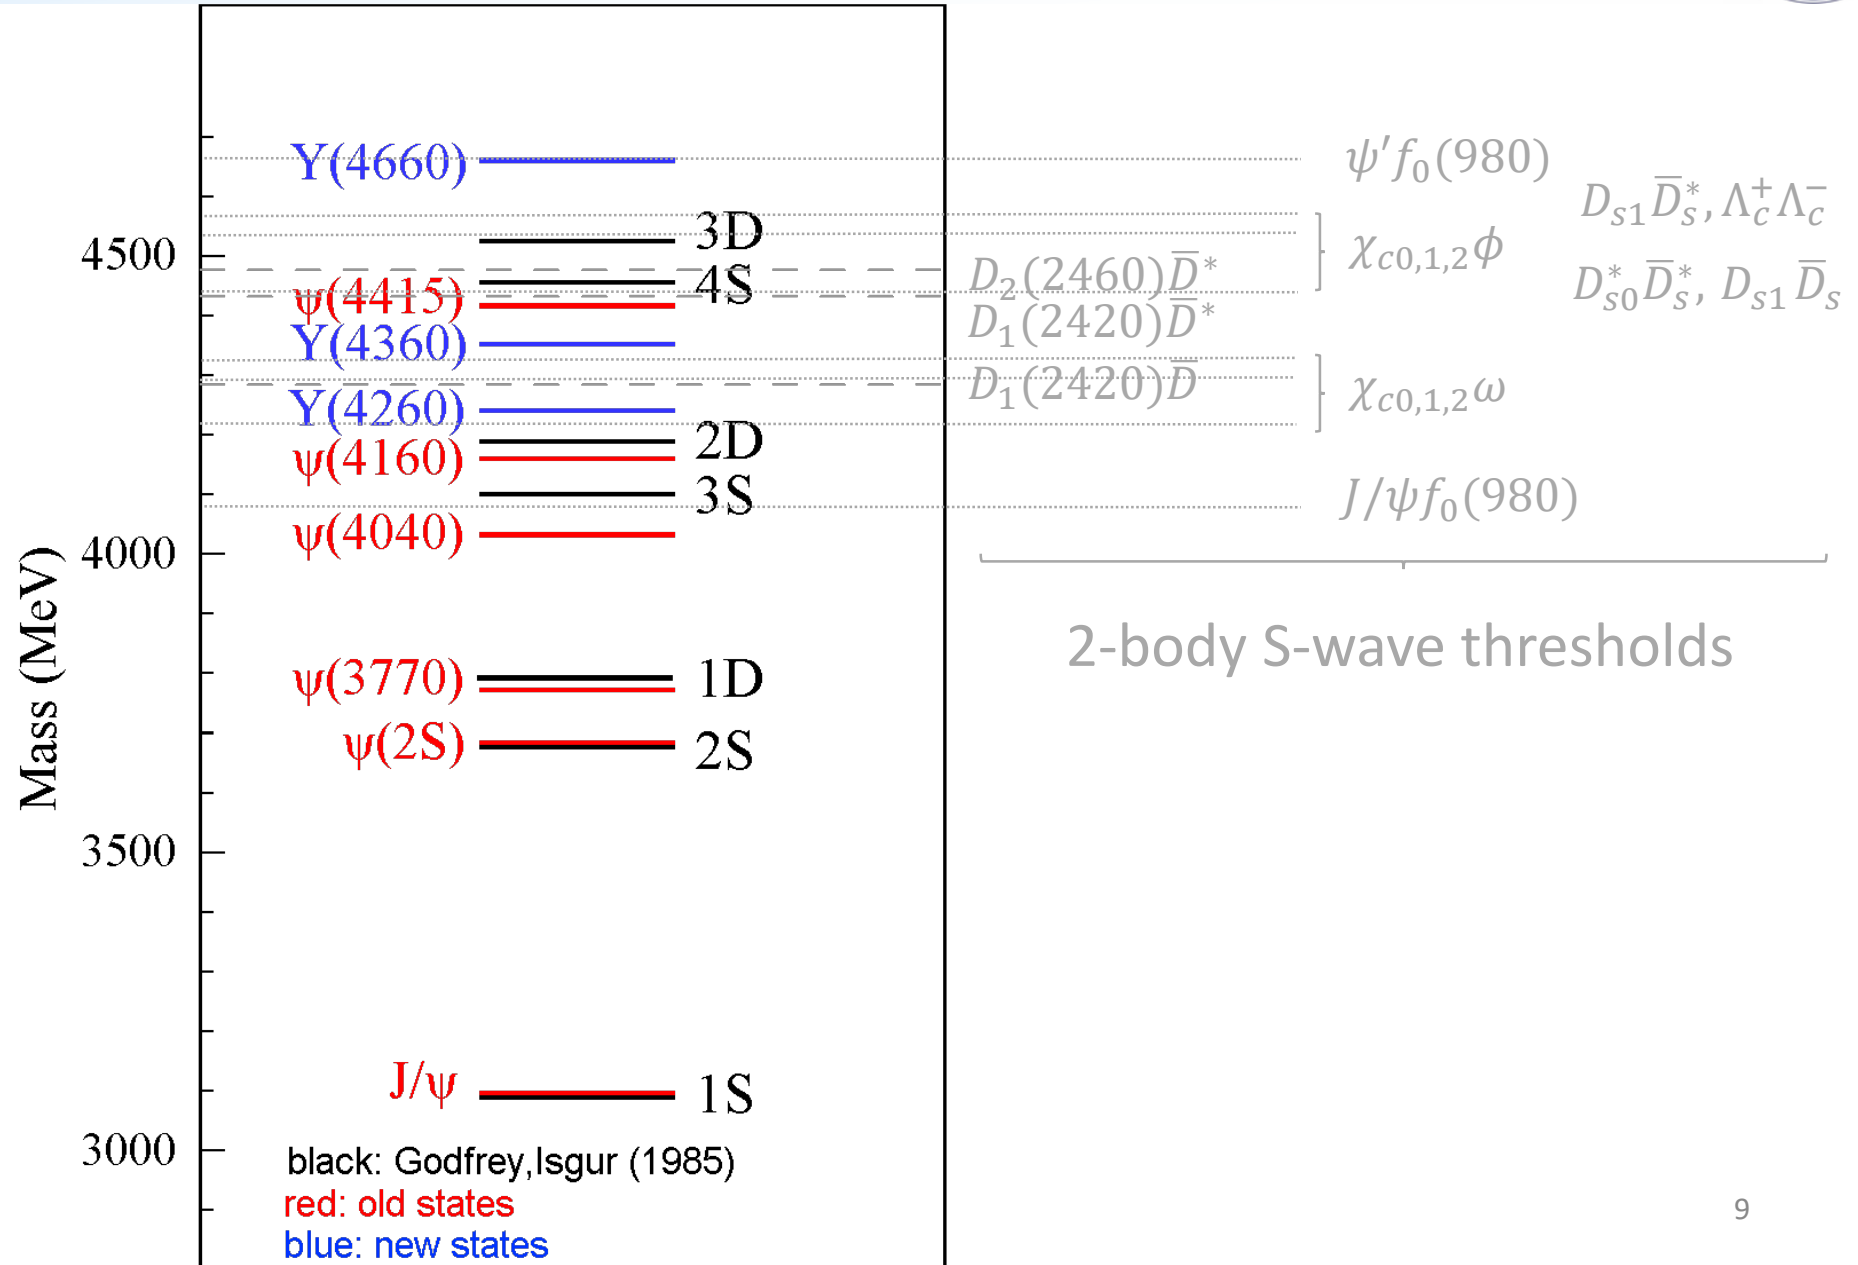

Lattice QCD, L. Liu et al.,  
 JHEP1207,126

- Too many vector states (6+3) compared to potential model predictions or lattice QCD results using only  $c\bar{c}$  operators
- Not seen in  $D\bar{D}$ , while  $B(\psi(3770) \rightarrow D\bar{D}) = (98_{-9}^{+8})\%$

# Y: many thresholds above 4 GeV

# From Y to X and Z

- Strong **S-wave** coupling of  $Y(4260)$  to  $D_1\bar{D} + c. c.$
- Strong **S-wave** coupling of  $X(3872)$  and  $Z_c(4020)$  to  $D^*\bar{D} + c. c.$

FKG et al., PLB725(2013)106

Q. Wang, C. Hanhart, Q. Zhao, PRL111(2013)132003

BESIII observed  $e^+e^- \rightarrow \gamma X(3872)$  at  $E = 4.26$  GeV

# From Z to X ?

- Similarly, strong **S-wave** coupling of  $Z_c(4020)$  to  $D^* \bar{D}^*$  ; strong **S-wave** coupling of  $X(3872)$  to  $D^* \bar{D} + c.c.$
- $Z_c(4020)^0 \rightarrow X(3872)\gamma$  and  $Z_c(4020)^\pm \rightarrow X(3872)\pi^\pm$

M. Voloshin, 1902.01281

- Branching fractions **strongly energy-sensitive**,  $\sim$  permil to percent level
- Reason: **triangle singularity** close to the physical region

# From $Y$ to $X_2$ ?

- $X_2$ :  $2^{++}$ ,  $M \approx 4$  GeV,  $D^* \bar{D}^*$ , spin partner of  $X(3872)$  in hadronic molecular model

Nieves, Pavon Valderrama, PRD86(2012)056004

Small width  $\lesssim 50$  MeV

Albaladejo et al., EPJC75(2014)547; Baru et al., PLB763(2016)20

- Methods of producing  $X_2$  in  $e^+e^-$ :

- $e^+e^- \rightarrow \gamma X_2$ ,  $X_2 \rightarrow D\bar{D}, D\bar{D}^*, J/\psi\omega$

FKG, Meißner, Yang, PLB740(2015)42

$$\sqrt{s} \sim 4.26 \text{ GeV} + (M_{D_1/D_2} + M_{D^*}) - (M_{D_1} + M_D) \sim [4.4, 4.5] \text{ GeV}$$

- $\gamma\gamma \rightarrow X_2 \rightarrow D\bar{D}, D\bar{D}^*, J/\psi\omega$

No signal in existing data for  $\gamma\gamma \rightarrow D\bar{D}$

FKG, Meißner, PRD86(2012)091501

# XYZ at SCTF/STCF

- No clear pattern for XYZ so far: to establish the hidden-charm spectrum far beyond 4 GeV, necessary to establish a pattern
- To study the known **vector states and  $Z_c$**  in much more detail; higher vector spectrum
- For  $J^{++}$  excited states with **masses about 3.8-4 GeV**: At SCTF/STCF, hadronic channels:  
 $E \gtrsim 4.7 \text{ GeV}, e^+e^- \rightarrow \omega X(J^{++})$
- To study the **heavier  $PC=++$  states observed in  $\phi J/\psi, E > 5 \text{ GeV}, e^+e^- \rightarrow \phi X(J^{++})$**
- $E > 5 \text{ GeV}$ , to reveal expected rich phenomena **above charm baryon-antibaryon thresholds**; also above thresholds of excited charm-meson pairs; physics of **excited charm mesons**
- $E > 5 \text{ GeV}$ ,  $J/\psi p\bar{p}, \Lambda_c \bar{D}\bar{p}, \dots$  accessible, **hidden-charm pentaquarks, rich spectrum above  $\Lambda_c \bar{D}$  threshold**
- Energy can vary  $\Rightarrow$  **handle of kinematic singularities in multi-hadron final states**

# Looking forward to new discoveries

Experiments

Lattice

EFT, models

**HADRON**2019: August 16-21, 2019, Guilin, China

<http://hadron2019.csp.escience.cn>

<https://indico.ihep.ac.cn/event/9119>

# Thank you for your attention!

# XYZ: no clear pattern

# Y(4260): puzzling features

- No obvious slot in charmonium spectrum in quark model
- Not seen in R-scan
- Not seen in  $D\bar{D}$ ,  $D^*\bar{D} + c. c.$ , contrary to known  $\psi$  states above the  $D\bar{D}$  threshold
- The only observed open-charm channel:  $D^0D^{*-}\pi^+ + c. c.$
- Similar cross sections into spin-triplet and spin-singlet final states
  - Spin-triplet:  $J/\psi\pi^+\pi^-$ ,  $\chi_{c0}\omega$
  - Spin-singlet:  $h_c\pi^+\pi^-$
  - Mixture of spin-triplet and spin-singlet:  $D^0D^{*-}\pi^+ + c. c.$

# Y(4260): strong coupling to $D_1\bar{D}$

- Y(4260) as mainly a  $D_1(2420)\bar{D}$  hadronic molecule (never purely)

Q. Wang, C. Hanhart, Q. Zhao, PRL111(2013)132003

- a large coupling to  $D_1\bar{D} \Rightarrow$  large impact on the line shape

M. Cleven et al., PRD90(2014)074039

see also Qin et al., PRD94(2016)054035

$$M_Y = (4217.2 \pm 2.0) \text{ MeV}$$

BESIII data PRL118(2017)092001

# Triangle singularity

Logarithmic singularity  $\Rightarrow$  peak

$$\frac{1}{2m_A} \sqrt{\lambda(m_A^2, m_1^2, m_2^2)} \equiv \boxed{p_{2,\text{left}} = p_{2,\text{right}}} \equiv \gamma (\beta E_2^* - p_2^*)$$

**on-shell** momentum of  $m_2$  at the **left** and **right** cuts in the  $A$  rest frame

$$\beta = |\vec{p}_{23}|/E_{23}, \gamma = 1/\sqrt{1-\beta^2}$$

Bayar et al., PRD94(2016)074039

- $p_2 > 0, p_3 = \gamma (\beta E_3^* + p_2^*) > 0 \Rightarrow m_2$  and  $m_3$  move in the same direction
- velocities in the  $A$  rest frame:  $v_3 > \beta > v_2$

$$v_2 = \beta \frac{E_2^* - p_2^*/\beta}{E_2^* - \beta p_2^*} < \beta, \quad v_3 = \beta \frac{E_3^* + p_2^*/\beta}{E_3^* + \beta p_2^*} > \beta$$

- Conditions (Coleman–Norton theorem): Coleman, Norton (1965); Bronzan (1964)
  - ☞ all three intermediate particles can go **on shell simultaneously**
  - ☞  $\vec{p}_2 \parallel \vec{p}_3$ , particle-3 can catch up with particle-2 (**as a classical process**)
- needs very special kinematics  $\Rightarrow$  **process dependent!** (contrary to pole position)

# From Y to Z

- Strong S-wave coupling of  $Y(4260)$  to  $D_1\bar{D} + c. c.$
- Strong S-wave coupling of  $Z_c(3900)$  to  $D^*\bar{D} + c. c.$
- Natural production mechanism of  $Z_c(3900)$  :

- Enhancement due to closeness to thresholds

$$\mathcal{A} \sim \frac{v^5}{(v^2)^3} \text{Vertex}_{D_1 D^*}(p_\pi) = \frac{1}{v} \text{Vertex}_{D_1 D^*}(p_\pi)$$

Intermediate mesons are nonrelativistic,  $v \sim 0.1 \ll 1$

Power counting: 3-momentum  $\sim \mathcal{O}(v)$ , energy  $\sim \mathcal{O}(v^2)$

loop integral measure  $\sim \mathcal{O}(v^5)$ , propagator  $\sim \mathcal{O}(v^{-2})$

# From Y to Z

- Coupled-channel analysis with both FSI and triangle diagrams

Albaladejo, FKG, Hidalgo-Duque, Nieves, PLB755(2016)337

Blue bulbs: FSI T-matrix, it may or may not have a near-threshold pole ( $Z_c$ ); data will tell

Kinematical singularities (threshold cusp, TS) and resonances are NOT exclusive

# From Y to Z

Fit to BESIII data at 4.26 GeV

Albaladejo, FKG, Hidalgo-Duque, Nieves, PLB755(2016)337

$Z_c(3900)$  is needed: either a resonance or a virtual state, more precise line shape data needed

$M_{Z_c}$ (MeV)	$\Gamma_{Z_c}/2$ (MeV)	Ref.	Final state
$3899 \pm 6$	$23 \pm 11$	[1] (BESIII)	$J/\psi \pi$
$3895 \pm 8$	$32 \pm 18$	[2] (Belle)	$J/\psi \pi$
$3886 \pm 5$	$19 \pm 5$	[3] (CLEO-c)	$J/\psi \pi$
$3884 \pm 5$	$12 \pm 6$	[4] (BESIII)	$\bar{D}^* D$
$3882 \pm 3$	$13 \pm 5$	[5] (BESIII)	$\bar{D}^* D$
$3894 \pm 6 \pm 1$	$30 \pm 12 \pm 6$	$\Lambda_2 = 1.0$ GeV	$J/\psi \pi, \bar{D}^* D$
$3886 \pm 4 \pm 1$	$22 \pm 6 \pm 4$	$\Lambda_2 = 0.5$ GeV	$J/\psi \pi, \bar{D}^* D$
